

# Rocket<sup>®</sup> Business Rule Manager

(Formerly a Micro Focus<sup>®</sup> product)

Rocket<sup>®</sup> Business Rule Manager<sup>\*</sup> enables IT teams to discover hidden business logic that drives application behavior. By capturing these business rules, analysts and managers can ensure these systems operate as expected or as governed by regulation or industry. Development teams can also extend the value of proven business rules by reusing them within a web or microservices architecture.

## **Business Challenge**

The applications that run your business have been substantially customized to support your unique requirements. This specialized business logic controls the behavior of your organization and sets you apart from your competitors. So these rules embedded in your applications are critical business assets that must be understood, managed and reused.

The challenge, however, is that business rules are often buried across millions of lines of code. No current documentation exists to help you understand these systems. On top of this, the rules themselves are frequently modified and duplicated as change requests come in. This leads to:

#### Inability to adapt

When business users want to adapt processes or add new offerings they need to change the logic of applications, but limited insight into your business rules hinders this change.

#### Poor governance

Internal audits and government regulations demand that you have control over the behavior of your company, which requires you to understand your business rules.

#### Need to modernize

Your business logic is a valuable asset that has been refined to support your corporate strategies. You should ensure that this logic can be reused where possible and extended to support a flexible API-driven or service-oriented approach.

## **Product Overview**

Rocket Business Rule Manager accelerates the discovery, documentation, and organization of business rules hidden deep within enterprise applications. Unlike lightweight business rule scanning technologies, Rocket Business Rule Manager offers patented automatic and analyst-centric paths to locate logic.

Once discovered, the module provides a variety of documentation capabilities for users to associate business-centric intelligence with rules. The collected information is stored in an Enterprise-grade database, ensuring that the collected data can be readily accessed and repurposed.

Rocket Business Rule Manager is a module within the market-leading Rocket Enterprise Analyzer\* platform.

## **Key Benefits**

Rocket Business Rule Manager enables organizations to regain control over how their application portfolio behaves. Key advantages for IT organizations include:

#### **Regain management control**

Insight into business rules ensures that managers have control over operational behavior and can prove regulatory compliance. This also improves change request development and eases communication between business and technical users, cutting turnaround and rework.

#### Accelerate development activities

Development team members can quickly understand where and how to make required changes to their applications to respond to business needs. This knowledge means that change requests can be executed faster, cutting up to 45% of the time required to complete a business requirement.

#### **Encourage reuse**

Business logic is frequently shared by multiple processes. So, it is important that best-in-class logic is reused where possible. By uncovering and reusing existing rules, teams can respond more quickly and have less code to maintain going forward.

#### **Enable modernization projects**

By uncovering and organizing existing business rules, you can ensure that your modernized applications retain the business logic that you depend on. This avoids disruptions to day-to-day operations and preserves what makes your business unique.

## Accelerate implementation of microservices and other modern architectures

You can create significant value by extending business processes to connect with other systems. For instance, you may wish to make order management available to partners. By locating business logic in your system, you can more readily join its inputs and outputs to external applications.

## **Feature Overview**

Automatic creation of business rule templates that covers the entire program code. This allows a quick ramp up of business rule extraction initiatives.

Business context views enable users to focus rule searches on a particular process, geography, or other user defined filter, targeting the scope of analysis.

Easy access to business rules information using an intuitive web client.

Powerful analytics enable users to manually navigate their code to quickly uncover business rules.

Business rules can be exported from the repository for integration into business rules engines and requirements management tools, ensuring that logic can be preserved and reused.

**Fig 3.** Easy access to business rules information using an intuitive web client

Changes in the application are synchronized with associated rules so that the linkage between logic and its underlying source code is kept current.

Organization tools enable analysts to construct chains of rules and to arrange them based on useful hierarchies, further enhancing knowledge transfer.

An integrated glossary connects technical terms, for instance on variable names, with business terms. This makes query results and business rules more meaningful to analysts and managers and enhances cross functional communication.

An enterprise-class repository enables large development teams to access and enrich one 'source of truth' about business rules in the application portfolio, improving collaboration and communication across global teams.

## With Rocket Business Rule Manager you can:

## **System Requirements**

- To enable Rocket Business Rule Manager, Rocket Enterprise Analyzer Analyst Client is required as a pre-requisite.
- Please see the Rocket Enterprise Analyzer Data Sheet • on www.rocketsoftware.com or contact Rocket<sup>®</sup> Software for further details.
